Westminster Village, Inc., a not-for-profit continuing care retirement community, has contracted with Energy Systems Group (ESG) to complete several energy-saving projects on its campus located at 2025 E. Lincoln Street, Bloomington.

The construction of a geothermal well field will take place along the Veteran's Parkway side of Westminster Village's campus. The geothermal solution will replace Westminster Village's existing heating and cooling system. Geothermal (geoexchange) systems use the earth's energy storage capability to heat and cool buildings. Through a system of underground pipes, heat is transferred from the earth to the building in the winter. In the summer, heat from the building is discharged into the cooler ground. This heating and cooling system is energy-efficient, environmentally clean and cost-effective. To enhance this infrastructure investment, changes to the existing piping, lighting and ventilation systems will be upgraded.

Upon completion of the geothermal well field, new landscaping will be added and improvements to the drainage system will be made. The project is expected to be completed in March of 2014.
